

Appl. No. 09/788,936
Atty. Docket No. 7275
Amdt. dated 10/29/2003
Reply to Office Action of 7/31/03

AMENDMENTS TO THE CLAIMS

Claim 1. (*Currently Amended*) A continuous process for preparing a granular detergent agglomerate having a density of at least about 500 g/l, comprising the steps of:

- (a) in a first step, dispersing and mixing a liquid acid precursor of an anionic surfactant with a solid particulate water-soluble alkaline material in a high speed mixer for a mean residence time of about 0.2 to about 50 seconds, wherein the acid precursor is partly or totally neutralized, thereby forming a dry neutralized material comprising a salt of the anionic surfactant precursor in the form of a free-flowing powder; and
- (b) in a second step, dispersing and mixing an agglomeration binder which is a viscous surfactant paste having a shear-thinning rheology with an apparent yield stress (t_y) of greater than about 50 Pa with the free-flowing powder in a moderate speed mixer, said mixer having ~~one or more~~ chopper blades operating at a tip speed of at least 3m/sec, said agglomeration binder being dispensed directly at or slightly upstream from said ~~one or more~~ chopper blades and dispersed in as discrete mass units having an average equivalent diameter of from about 0.5 to about 4mm, thereby agglomerating the powder into granular detergent agglomerates.

Claims 2 and 3. (*Cancelled*).

Claim 4. (*Currently Amended*) A process according to claim 1 wherein the viscous surfactant paste comprises an anionic surfactant selected from the group consisting of alkyl sulfate, alkyl ethoxy(1) sulfate, alkyl ethoxy(3) sulfate, linear alkylbenzene sulfonate, branched alkyl benzene sulfonate, and mixtures thereof.

Claim 5. (*Cancelled*)

Claim 6. (*Original*) A process according to claim 1 wherein the solid particulate water-soluble alkaline material is finely divided sodium carbonate having a mean particle size of less than about 20 microns.

Claim 7. (*Original*) A process according to claim 1 wherein the granular detergent agglomerates have a mean particle size of about 400 to 1000 microns, and a geometric standard deviation of less than 2.5.
